One ILSI project on healthy aging: the story of a collaboration

ILSI Branch Collaborators:
Southeast Asia, Taiwan, Korea, India, Mesoamerica, Argentina
How it all started

Mapping of activities across branches

Consensus to focus on healthy aging across countries
- Type of collaboration: narrative review
- Rationale: requires the least amount of resources
- Assigned co-leaders: ILSI SEA, ILSI Mexico

1\textsuperscript{st} step: drafting of the overall framework for the review
(iterative process among ILSI SEA, ILSI Mexico, reviewers)

2\textsuperscript{nd} step: distribution of the document to interested branches

3\textsuperscript{rd} step: group teleconference to discuss and clarify

4\textsuperscript{th} step: individual branches develop their own studies,
identify PIs, draft MOAs (funding of US $4000/branch)
Overall goal: To identify factors that contribute to healthy vs. pathological ageing
Objectives

• Describe the various demographic and cultural definitions of
  – ageing/elderly
  – healthy ageing
  – successful ageing
  in different countries

• Identify mid-life factors that influence ageing outcomes

• Describe pathways to disability in specific countries

• Identify country-specific best practices that are shown to promote healthy and successful ageing

• Identify gaps, research and policy needs for each country to achieve healthy and successful ageing
Significance of the review

- Healthy life expectancy (HALE)
  - the number of years that a person at a given age can expect to live in good health (taking into account age-specific mortality, morbidity, functional health status)

Global Burden of Disease Study 2015

Gap between life expectancy and HALE

- **Men**
  - 7.1 y (2005)
  - 8.1 y (2015)

- **Women**
  - 9.4 y (2005)
  - 10.0 y (2015)

(Expansion of morbidity)
CONCEPTUAL FRAMEWORK

Mid-life factors that minimize risk and disability

Mid-life factors that maximize physical and cognitive ability

Factors that promote engagement in social activities (mid- and later life)

National strategies and government policies to address ageing issues, social & nursing support

SUCCESSFUL AND HEALTHY AGEING
vs.
Pathological ageing
WHERE WE ARE NOW

</tr>
</tbody>
</table>
Multidimensional determinants of healthy ageing

- **Health Status**
  - Chewing ability
  - Better appetite
  - Maintenance of a healthy body composition

- **Behavior**
  - Dietary pattern
  - Cooking frequency

- **Social participation**
  - Weekly shopping
  - Eating with others

Dietary pattern/nutritional factors associated with frailty

- Predictability of low skeletal muscle mass on mortality.
- Prevalence of frailty increase with older age.
- Elderly people consume less and less calories with age. Quantity issue (=lowered dietary intake level) is crucial for the older TW elders rather than the quality of food consumed.
- Dietary intervention does work!
INDIA
(Completed report)
Model For Successful Aging

Project PI - Dr. Seema Puri, Associate Professor & Ms. Majida Shaheen, Research Fellow
Institute of Home Economics, University of Delhi

OBJECTIVES

1) Present the broad profile of 60 years and above in India.

2) Understand factors affecting healthy ageing including mid life factors that prevent / lead to disease.

3) Identify country-specific best practices that are shown to promote healthy and successful ageing.

4) Identify gaps, research and policy needs for India to achieve healthy and successful ageing.
This is a review of published articles and government reports. 273 articles and reports have been studied. The report includes the following components:

- **Demography of Ageing in India**
- **Concepts of Ageing**
- **Health and Morbidity Status of Indian Elderly**
- **Nutritional Status, Physical Activity and Lifestyle of Indian Elderly**
- **Midlife Factors that Influence the Ageing Process:**
  - The Asian Indian Phenotype, Non-Communicable Diseases, Intrauterine and Perinatal Nutrition, Physical Activity, Overweight/Obesity, Dyslipidaemia
- **Best Practices that Promote Healthy and Successful Ageing**
- **Identify Gaps, Research and Policy Needs for India to Achieve Healthy and Successful Ageing**

The Study has been completed.
**HIGHLIGHTS**

**Elderly Population**
- 2016: 116 Millions
- 2026: 150 Millions
- 2050: 323 Millions
- Life Expectancy increased to 68 years
- Number of 80 and above increased
- Numbers of Centurions 20,000
- Elderly female are more than elderly males (1022/1000)

**Characteristics**
- Lifestyle Approach
- Nutrition, Physical Activity, Lifestyle, Socio-economic environment → Leading To Micronutrient Deficiencies, Overweight & Obesity, Low Immunity, NCDs, Cancer, Arthritis, Osteoporosis

**Midlife Factors Affecting Ageing**

**Research**
- Regular Surveys on Health status, Diet, PA, Health Infrastructure, IEC.
Republic of KOREA

A Model for Healthy Aging in Korea

Objectives

- To identify the broad profile of 65 years and above in Korea
- To understand factors affecting healthy ageing including mid life factors that prevent or lead to disease
- To identify Korea-specific best practices that are shown to promote healthy and successful ageing
- To identify gaps, research and policy needs for Korea to achieve healthy and successful ageing
A Model for Healthy Aging in Korea

**Review of literatures**

A review on 224 articles and 9 public reports (*in preparation*)

- Definition of healthy aging
- Demography of aging in Korea
- Description of life style and healthy status
- Identification of multi-dimensional factors that influence aging, including nutritional, psychological, socio-economic, physical conditions

**A focused Review**

A focused review focusing on novel biomarkers in aging (*Submitted*)

- Identification of biological changes in aging
- Identification of novel biomarkers related with physiological status during aging
- Identification of multi-factors that influence and reverse the marker status

</tbody>
</table>
Next steps

• Publication in a peer-reviewed journal by individual countries/branches

• Compilation of studies into a single document (comparative analysis of findings)

• Submission of compiled document for publication in a peer-reviewed journal
Difficulties encountered

• A heavier workload (preparation of the framework, coordinating, integration of results into a single manuscript) has to be borne by one or two branches

• In Thailand, Malaysia
  – Lack of trained manpower who can do reviews in nutrition
Difficulties encountered

• In Argentina
  – National statistics lack data on critical information.
  – Obtaining funding for a field study is a huge challenge.
DIFFICULTIES ENCOUNTERED (ILSI-INDIA)

- Lack of Nationwide studies focusing on elderly
- Data on midlife factors influencing ageing per se were not available.
- Most of the data gathered have been deduced from research carried out on NCDs and their risk factors.
- Very few studies have been done to investigate the nutritional intakes and physical activity patterns of the Indian elderly. No RDAs for elderly, except for energy as yet.
Summary of lessons learned

I. Planning stage (global level) - steps followed

– Identification of common topic/type of project to be undertaken (outcome of mapping exercise)
– Lead writer/s identified to write the draft proposal/protocol
– Expert reviewers provided feedback to initial drafts of the proposal/framework
– Draft framework distributed and discussed with all participating branches
Lessons learned

• Characteristics of the framework
  – Serves as a guide for branches to develop their own plans of study
  – Specific enough to provide direction & clear output
  – Broad enough to accommodate diverse priorities/interests of different branches (studies across branches are similar but not identical)
Lessons learned

II. Planning stage (branch level) - steps followed

• Development of criteria for each branch’s plan of study
  – Study falls within the general framework/proposal
  – Relevant and useful to the specific country where the study will be done (contributes to body of knowledge for that country)
  – Within the branch’s priorities
  – Within the PI’s field of interest/expertise
  – Within the available budget of $4000 per branch
Lessons learned

III. Implementation stage (current stage)

• More time is needed to achieve the objectives of the project
  – Some branches started later than others
  – Branches differ in their ability to address difficulties encountered (e.g., financial, manpower)
  – Some PIs have excessive workloads
  – Publishing in a scientific journal takes time
Challenge ahead

IV. Collation of manuscripts into a single document

– To be started once reports are completed

– Potential difficulty:
  • Putting the results in review format following PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) guidelines will be a challenge
Moving forward

• Healthy aging project will need more time to complete for the ff. reasons:
  – 2 levels of output: 1) individual branch level, 2) global level
  – Difficulties arise that cannot be predicted (e.g., some PIs esp. those in SEA are not very familiar with the PRISMA format for review)
  – Short-term solutions are needed to achieve the long-term goals stated in the framework (e.g. how to assist some PIs to get individual reports published in scientific journals)
  – Still a lot of work ahead to prepare the final compiled document and submit for publication
Future action

• Need to plan beyond the current healthy aging project
  – what to do next
  – how to do it better
ACKNOWLEDGEMENTS

• Dr. Chor San Khoo (ILSI NA) for providing feedback to initial drafts of the proposal
• Dr. Guillermo Melendez (formerly ILSI Mexico) for contributing to development of the proposal
• All participating ILSI branches
THANK YOU
